New tyrosine biosynthetic enzyme, chorismate dismutase, proteins and nucleic acids, useful for facilitating design and/or identifying inhibitors of those enzymes that may be used as herbicides and for

producing antibodies.

The invention discloses isolated polynucleotides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets of onverted to anithranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine converted to prephenate. Also disclosed are methods for selecting an isolated polympetide are methods for selecting an isolated conjustification of a tyrosine polympetide in a host cell, obtaining a nucleic acid fragment encoding a tyrosine biosynthetic enzyme polypeptide and evaluating compounds for their ability to inhibit the activity of a tyrosine biosynthetic enzyme polypeptide can be used produce antibodies. Chorismate mutase and prephenate dehydrogenase are good targets for herbicides that will not affect animals, and overexpression of these enzymes may be used to increase the content of aromatic amino acid in food crops: The polypeptides may be used to design and/or identify inhibitors of those enzymes that may be used as herbicides. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              identify inhibitors of those argames that may be used as herbicides. The mucleic acids may be used to create transgenic plants, as probes for the genetic and physical mapping of the genes and as markers for traits linked to those genes. The sequence presented is a rice chorismate mutase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    24 TGGCCAAAGCAGCAGAACAAAGTCCTGATTCTGGGAATGTGTACACGCTAGCTTCTGTGA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a full-length cDNA encoding Arabidopsis thaliana chorismate mutase-1 (CM), an enzyme that catalyses the conversion of chorismate to prephenate in a branch of the shikimate pathway leading to phenylalanine and tyrosine biosynthesis. CM is essential for plant growth, inhibition of CM gene expression in plant abnormalities. The invention provides compositions for the modulation of plant growth or development using CM antisense (see ABA91399) and sense polynucleotides, double-stranded RNA and ribozymes, and related polynucleotides, double-stranded RNA and ribozymes, and related useful for the modulation and inhibition of plant growth, and for generating male sterile plants or plants that produce seedless fruit. CM is also a target for the identification of herbicides, and methods are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying compounds useful for modulating and inhibiting plant growth and development, by using chorismate synthase and chorismate mutase as targets which are essential for plant growth.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of an antisense oligonucleotide that is specific for Arabidopsis thaliana chorismate-mutase-1 (CM) mRNA. CM catalyses the conversion of chorismate to prephenate in a branch of the shikimate pathway leading to phenylalanine and tyrosine biosynthesis. It sesential for plant growth; inhibition of CM gene expression in plant seedlings results in severe chlorosis, reduced growth and developmental abnormalities. The invention provides compositions for the modulation of plant growth or development using CM antisense and sense polynucleotides, double-stranded RNA and ribozymes, and related expression cassettes and vectors. The compositions are particularly useful for the modulation and inhibition of plant growth, and for generating male sterile plants or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          68 ACGCTAGCTTCTGTGAGAGAGTTTGGTTAGGCAAGAGGATACCATCATTTATGGTCTC 127

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid arrepresentative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abloric stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             547
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        367
Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.

The invention discloses isolated polymuclectides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets of animals: In the aromatic amino acids must be included in the diets of animals: In the aromatic amino acid biosynthesis and is converted to anthranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine converted to prephenate. Also disclosed are methods for selecting an isolated polymethetic enayme polypeptide in a host cell, obtaining a nucleic acid fragment encoding a tyrosine biosynthetic enayme polypeptide and ritiodics. Chorismate mutase ability to inhibit the activity of a tyrosine biosynthetic enayme polypeptide and entibodies. Chorismate mutase and prephenate dehydrogenase are good targets for herbicides that will not affect animals, and overexpression of these enaymes may be used to increase the content of aromatic amino of these maymes may be used to increase the content of aromatic amino dentify inhibitors of those enzymes that may be used as herbicides. The polypeptides may also be used as defined and vor identify and physical mapping of the genes and as markers for traits and a mutase mutase mutase and as markers for traits mutase mutase.
                                                                                                                                                                                                                                     Corn; plant; gene; ss; chorismate mutase; aromatic amino acid; diet;

New tyrosine biosynthetic enzyme, chorismate dismutase, proteins and nucleic acids, useful for facilitating design and/or identifying inhibitors of those enzymes that may be used as herbicides and for producing antibodies.

Claim 3; Page 23; 32pp; English.

mutase polypeptides. Aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets of animals. In the aromatic amino acid biosynthetic pathway chorismate is converted to anthranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine biosynthesis. Chorismate mutase catalyses the conversion of chorismate to prephenate. Also disclosed are methods for selecting an isolated polymucleotide that affects the level of expression of a tyrosine biosynthetic enzyme polypeptide in a host cell, obtaining a nucleic acid fragment encoding a tyrosine biosynthetic enzyme polypeptide and fragment encoding a tyrosine biosynthetic enzyme polypeptide and a tyrosine biosynthetic enzyme. The polypeptides can be used produce antibodies. Chorismate mutase and prephenate dehydrogenase are good attrobates for therbicides that will not affect animals, and overspression of these enzymes may be used to innorease the content of aromatic amino acid in food crops. The polypeptides may be used to correate transgenic plants, as probes for the genetic and physical mapping of the genes and as markers for traits and overspression of the genetic and physical mapping of the genes and as markers for traits and the content of an wheat chorismate The invention discloses isolated polynucleotides encoding mutase cDNA

The present sequence is that of a full-length cDNA encoding Arabidopsis thaliana chorismate mutase-3 (CM), an enzyme that catalyses the conversion of chorismate to prephenate in a branch of the shikimate pathway leading to phenylalanine and tyrosine biosynthesis. CM is essential for plant growth; inhibition of CM gene expression in plant seedlings results in severe chlorosis, reduced growth and developmental abnormalities. The invention provides compositions for the modulation of plant growth or development using CM antisense (see ABA91401) and sense polynucleotides, double-stranded RNA and ribozymes, and related polynucleotides and vectors. The compositions are particularly useful for the modulation and inhibition of plant growth, and for generating male sterile plants or plants that produce seedless fruit. CM is also a target for the identification of herbicide candidates. Methods are also provided for in the identification of herbicide candidates. Methods are also provided for identification of herbicide candidates. Methods are also provided for incompounds that stimulate the expression or function of CM. These can be used to promote growth and

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 13, F
